Testing the Waters Before Diving in

Determining the Type of Knowledge Gap and the Readiness of Knowledge to Fill It

Travis Sztainert, PhD
Background

- Interest in knowledge translation started during PhD and postdoctoral fellowship
  - Knowledge translation associate for CUGL’s GREaT Hub at Carleton University
- Knowledge broker, content specialist—GREO
- Knowledge mobilization specialist—Frayme
What Is Knowledge Translation?

More than 100 terms that refer to all or sub-component of KTE

- Knowledge translation, transfer, mobilization, management, exchange
- Diffusion of innovation
- Research use/impact, utilization, uptake
- Broader impact
- Implementation Science

Plethora of frameworks and models

- Some based on iKTE, some focus on end-of-grant
- Not enough focus on the stages ‘before’ KTE

I needed clarity, so I created my own!

The Knowledge Determination Phase

[Diagram showing steps and flowchart related to knowledge determination and exchange in gambling research.]
Knowledge-to-Action Gap

Knowledge
Innovation
Discovery

Action
Implementation
Applicability
Knowledge-to-Action Gap (cont’d.)

Knowledge → Innovation → Discovery

Implementation

Applicability
Specific Micro-Gaps?

Knowledge → Action

Two Overarching Gaps
Attitude/Value-to-Action Gap

What people say they value and want =/= what they do.
  - Discrepancy between stated values and behavior.

People are really bad at telling you what they want.
  - Other, more important considerations (e.g., cost) come into play when it is time to decide.

This gap is often addressed based on an information-deficit and rational-choice model of human behavior.
  - Cognitive or social-psychological theories of decisions fail to account for cultural, institutional, and structural constraints.
Intention-to-Action Gap

Models/research suggest that “intention” is one of the best predictors of behavior.

- Theory of Reasoned Action.
- Theory of Planned Behavior.
- Triandis’s Attitude-Behavior Theory.
- Prospection Motivation Theory.

Meta-analysis of meta-analyses suggests intention accounts for 28% variation in behavior.*

- Intentions change over time, but temporal stability does improve consistency between intention and behaviour.**

More Micro-Gaps
Communication-to-Action Gap

Poor directions/instructions for how to change.
  • People need to know why, where, what, when, who, and how.

May include miscommunication due to:
  • Lack of clarity around the goal.
  • Lack of clarity around “how to get to” the goal.
  • “False” communication or “other intentions” (lack of support).
Motivation-To-Action Gap

If people already know what/how to do something, but choose not to do it...

Reasons may be numerous:

- They don’t buy into it (lack of belief)
- It doesn’t make sense (lack of clarity)
- Anxious/concerned about change
- Distractions or lack of focus
- Not interested in making the effort to change
- Lack a big picture to guide them (lack of destination)

Is this “our” problem?

- Don’t people bring their own motivations?
Skills-To-Action Gap

Even if I understand knowledge, appreciate it, believe it, and want to change my behavior, I may lack experience.

The only thing that’s going to get me ready to hike the Appalachian Trail is a lot of practice and conditioning (multiple smaller hikes).

• Gear won’t help.
• Understanding the starting point and end point won’t help.
• Route planning won’t really help.
• Maybe spending time on elliptical and stair-climber will help a bit . . . but probably not.
Habit-To-Action Gap

Creating and maintaining new habits can be difficult.
  • New Year’s Resolution effect.

Unlearning/De-implementation
  • Does a new action require doing something familiar in a new way?
  • Old habits die hard (automatic processing).
    • Teaching an old dog new tricks is relatively easy.
    • Unteaching an old dog a trick it already knows is borderline impossible.
  • Requires conscious effort to do something new.
Environment-To-Action Gap

The environment isn’t set up to let people succeed.

- Do processes in an organization support the change?
- Are there materials, references, and aids to support a person in his or her environment?
- Are people being rewarded for making the change?
- Is the change being reinforced over time?

This is where change management can help!
Possible Micro-Gaps

Knowledge → Motivation → Skills → Habit → Environment → Action

- Attitude/Value-to-Action Gap
- Intention-to-Action Gap
Nothing New
Attitude/Value-to-Action Gap

There exist numerous frameworks and models that can help examine the attitude/value-to-action gap, including:

• The theory of planned behaviour
• Social cognitive theory
• Health belief model
• Stages of change model
Intention-to-Action Gap

Similarly, there are frameworks and models that can help examine the attitude/value-to-action gap, including:

• Maslow’s hierarchy of needs
• Hierarchy of the four sources of motivation
• Arnold’s appraisal theory of emotion
Gap-Assessment Tool?

Knowledge
  • Do individuals realize there is a way to fill the K2A gap?
  • Do they know the knowledge exists?

Communication
  • Are the goals clearly communicated and understood?

Motivation
  • Are individuals resistant to changing course?
  • Is there apathy toward the change?

Skill
  • Is it reasonable to think someone can fill the K2A gap without practice?
  • What will they need to practice? Where are opportunities for them to practice?
Gap-Assessment Tool?

Habits
- Are the required behaviors habit?
- Are there any existing habits to be unlearned?

Environment
- Are there factors in the environment preventing individuals from being successful?
- What do individuals need from the environment to make them successful?
Is Knowledge Available and Ready?
Back to the Knowledge Determination Phase
Identifying the potential problem or issue
Determining what knowledge currently exists
Determining if knowledge is ready to be used
How to determine readiness?

When considering end of grant KT activities, it is critical to consider the strength of the evidence and its significance and tailor our strategies as appropriate (p. 5).

Not all knowledge is born equal; it exists on a continuum of readiness for use.

- Thus, even though knowledge may exist to address an identified problem, it may not be ready for use.

Decisions about the extent and ambitiousness of KT plans should be guided by the reliability, validity, strength, and significance of research findings (p. 76).

Overarching Criteria

1. The evidence in hand is couched within a larger body of work and exists within a solid foundation of valid, high-quality theory and research.
   - Do not place excessive emphasis on the results of single small studies, studies of poor methodological quality, or studies in which the strength of the evidence is low.
     - Helps to address cherry-picking and media-bias.
   - Important that the knowledge (be it from a primary study or a systematic review) is of high quality.
     - What is knowledge?
       - Rigor versus relevance; research versus practice-based evidence.
     - Some authors argue that knowledge synthesis (systematic reviews) should be considered the base unit of knowledge translation.
Overarching Criteria (cont’d.)

2. The evidence is relevant/appropriate for the targeted domain of use.
   • Evidence should be considered of major significance to knowledge users.
   • Evidence should be locally relevant and adaptable to its targeted domain of use.

3. The evidence will have a significant impact on the knowledge users or systems.
   • If evidence has the opportunity to greatly impact the health or well-being of the knowledge users, it is worth furthering KT efforts.
Tool Design

The tool is divided into two sections:
- Quality and strength of evidence.
- Significance of evidence.

The tool is designed to be used by anyone who wants to assess the KT readiness of completed or near-completed research (i.e., end-of-grant), their own research, or the research of others.

Current checklist deals with “empirical evidence” (health and social science perspective).
- Initial considerations of the basis of empirical evidence are based on the evidence pyramid.
- This section can/should be adapted to meet the needs of your organization.
Tool Blueprint
### End-of-Grant Readiness Tool

<table>
<thead>
<tr>
<th>INITIAL CONSIDERATION</th>
<th>POINTS</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>desired change?</td>
<td>+5</td>
</tr>
<tr>
<td>YES</td>
<td>+5</td>
</tr>
<tr>
<td>NO</td>
<td>0</td>
</tr>
</tbody>
</table>
Readiness Outcomes

Each section contains scoring criteria that is then summed and that results in one of three readiness outcomes:

- Low readiness = More research + Passive dissemination
- Moderate readiness = Active dissemination
- Higher readiness = Implementation
Readiness Outcomes

Low readiness to translate:

- The evidence is not yet ready to be translated.
- More high-quality, highly significant research needs to be conducted.
- Passive dissemination (also called diffusion) strategies are appropriate.
- In addition, stakeholders should be consulted to make sure results of future research will be of value.

Examples:

- Presentations at academic conferences or sharing the knowledge on research-centered media.
- Focus groups with knowledge users and stakeholders facilitated to determine their most pressing upcoming issues.
Readiness Outcomes (cont’d.)

**Moderate readiness to translate:**

- Ready for more active approaches to dissemination.
- Targeting audiences other than researcher may be useful.

*Active...approaches may include tailoring the message and medium to the specific audience; linking researchers and knowledge users through linkage and exchange mechanisms, such as small workshops focused on the dissemination of a synthesized body of knowledge or those focused on developing a user-driven dissemination strategy; engaging media; using knowledge brokers; or creating networks or communities of practice involving both researchers and knowledge users* (p. 77).

Readiness Outcomes (cont’d.)

High readiness to translate:

- The evidence may be highly useful and therefore should go beyond the regular means of dissemination.
- Consider implementation of evidence into practice.
- For implementation, you need to decide if you want to use the knowledge to promote change in attitudes or behavior or to influence decision making.

Example

- You may want to begin with a small-scale pilot project targeting a population in a local setting. Make sure to secure early involvement of knowledge users and stakeholders.

Partnership, Iteration, and Testing

Working with Dr. Belinda Goodenough from Dementia Training Australia to help inform a Readiness for KT Tool (R4KT) protocol.

Presented initial findings at the 2019 Australian Dementia Forum:

Plan to publish this tool online as part of the web portal for Dementia Training Australia.
Thank you.

Always interested in collaborations and sharing, so don’t be shy!
